The Integration of Pharmacy and Nutrition in the Prevention of Obesity and Diseases Metabolic: A Review of Contemporary Scientific Evidence

The Integration between Pharmacy and Nutrition in the Prevention of Obesity and Metabolic Diseases: A Review of Contemporary Scientific Evidence

The integration of pharmacy and nutrition in the prevention of obesity and metabolic diseases: a review of contemporary scientific evidence

Letícia Valadão Duarte1

Summary

Obesity and associated metabolic diseases constitute a global public health crisis, requiring complex and multidimensional therapeutic approaches. The traditional biomedical model, centered on isolated interventions, has proven insufficient to contain the advance of these chronic pathologies. This article presents a narrative literature review aiming to analyze contemporary scientific evidence regarding the interprofessional integration between Pharmacy and Nutrition in the prevention and management of obesity. The research explores the axes of modern pharmacotherapy, drug-nutrient interactions, evidence-based supplementation, and the application of lifestyle medicine.

The results show that pharmacotherapeutic monitoring, aligned with nutritional therapy, optimizes the effectiveness of new anti-obesity agents, mitigates adverse gastrointestinal effects, and prevents iatrogenic nutritional deficiencies. It is concluded that synergistic collaboration between pharmacists and nutritionists is essential for long-term clinical success, promoting sustainable weight loss, metabolic re-education, and improved quality of life for patients.

Keywords: Clinical Pharmacy; Nutritional Therapy; Pharmacotherapy of Obesity; Drug-Nutrient Interactions; Lifestyle Medicine.

Abstract

Obesity and associated metabolic diseases represent a global public health crisis, requiring complex and multidimensional therapeutic approaches. The traditional biomedical model, centered on isolated interventions, has proven insufficient to contain the advancement of these chronic pathologies. This article presents a narrative literature review analyzing contemporary scientific evidence on interprofessional integration between Pharmacy and Nutrition in the prevention and management of obesity. The research explores the axes of modern pharmacotherapy, drug-nutrient interactions, evidence-based supplementation, and the application of lifestyle medicine.

The results show that pharmacotherapeutic follow-up aligned with nutritional therapy optimizes the efficacy of new anti-obesity agents, mitigates gastrointestinal adverse effects, and prevents iatrogenic nutritional deficiencies. It is concluded that the synergistic collaboration between pharmacists and nutritionists is indispensable for long-term clinical success, promoting sustainable weight loss, metabolic re-education, and improvement in patients' quality of life.

Keywords: Clinical Pharmacy; Nutrition Therapy; Obesity Pharmacotherapy; Drug-Nutrient Interactions; Lifestyle Medicine.
