The integration of business development and operations management: structure of production processes and innovation as vectors of competitive advantage

Eduardo Pires de Freitas,

Business Management Specialist.

SUMMARY

The contemporary business environment demands the adoption of management strategies that harmonize operational efficiency with the sustainable expansion of markets. This scientific article analyzes the intersection between business development, production process management, and the technical improvement of industrial products. The research examines operational planning methodologies used to reduce waste and maximize the longevity of physical assets. The study adopts a mixed methodological approach, supported by a systematic review of the literature updated to 2025 and by the documentary analysis of industrial reliability indicators. The results demonstrate that the standardization of procedures, combined with rigorous team training, constitutes the central pillar for creating a competitive advantage in high-precision sectors. It concludes that the integration between corporate technical research and institutional negotiation allows for safe international expansion, ensuring the organization's profitability and the resilience of the supply chain.

Keywords: Business Development. Operations Management. Strategic Planning. Product Innovation. Competitive Advantage.

ABSTRACT

The contemporary business environment requires adopting managerial strategies that harmonize operational efficiency with sustainable market expansion. This scientific article analyzes the intersection between business development, production process management, and the technical improvement of industrial products. The research examines the operational planning methodologies used to reduce waste and maximize the longevity of physical assets.

The study adopts a mixed-methods approach, supported by a systematic literature review updated through 2025 and document analysis of industrial reliability indicators. The results demonstrate that the standardization of procedures, combined with rigorous team training, constitutes the central pillar for creating a competitive advantage in high-precision sectors. It is concluded that integrating corporate technical research with institutional negotiation enables safe international expansion, ensuring the organization's profitability and supply chain resilience.

Keywords: Business Development. Operations Management. Strategic Planning. Product Innovation. Competitive Advantage.
