Strategic Integration between Supply Chain Management and Distribution Logistics: Mathematical and Operational Models Applied to Efficiency in the Consumer Goods Retail

Summary

The synchronization between supply management and distribution logistics constitutes one of the fundamental pillars of contemporary Production Engineering. This article analyzes supply chain optimization methodologies, with emphasis on the application of demand forecasting and inventory management models in highly capillary logistics environments. The research discusses how the integration of systems and the adoption of performance metrics allow for cost reduction and increased service levels. The study concludes that efficiency in the national distribution of consumer goods depends on the robustness of planning processes and the systemic responsiveness of the chain to exogenous market variables.

Abstract

The synchronization between supply management and distribution logistics is one of the fundamental pillars of contemporary Production Engineering. This article analyzes supply chain optimization methodologies, highlighting the application of demand forecasting models and inventory management in high-capillarity environments. The research discusses how systems integration and the adoption of performance metrics allow for cost reduction and increased service levels. The study concludes that efficiency in the national distribution of consumer goods depends on the robustness of planning processes and the chain's systemic response capacity to exogenous market variables.
