# Integration and Sustainability of Mainframe Systems in Corporate Environments High Complexity

*Integration and Sustainment of Mainframe Systems in Highly Complex Corporate Environments*

Integration and sustainability of mainframe systems in highly complex corporate environments

**Lindslei Chimchek**

Technologist in Data Processing (Faculdades Spei), Specialist in Database Administration (FESP).

**Summary:**

This scientific article investigates the methodologies applied to integration and to Sustainability of mainframe architecture systems, with a particular focus on the financial and automotive sectors. The study analyzes the challenges of maintaining critical operational infrastructures written in legacy languages, especially COBOL, associated with DB2 databases. Through the evaluation of practical data governance scenarios, the work proposes guidelines for the secure modernization of corporate platforms, without interrupting business continuity.

**Keywords:** Mainframe, COBOL, Systems Integration, DB2 Database, Financial Sector.

**Abstract:**

This scientific article investigates the methodologies applied in the integration and sustainability of mainframe-based systems, with a particular focus on the financial and automotive sectors.
The study analyzes the challenges of maintaining critical operational infrastructures written in legacy languages, especially COBOL, associated with DB2 databases. Through the evaluation of practical data governance scenarios, the work proposes guidelines for the secure modernization of corporate platforms without disrupting business continuity.
**Keywords:** Mainframe, COBOL, Systems Integration, DB2 Database, Financial Sector.

## Introduction

The technological infrastructure of large global corporations rests on foundations computational systems designed to offer maximum stability and maximum power. Processing. Banking institutions and multinational automotive industries depend on Mainframe architectures for managing colossal volumes of daily transactions. This choice Technological advancements justify the longevity of languages like COBOL, which still processes the vast amount of data. Most financial and billing operations worldwide. The need for Mathematical precision and referential integrity make the abrupt replacement of these systems an unacceptable risk.

In the current context of digital transformation, modernizing the technology infrastructure requires... approaches that integrate these robust structures with new web and mobile platforms. A Technological transition demands highly qualified professionals capable of understanding

business rules that have been codified for decades. The success of this integration lies in the ability to build secure communication layers, enabling modern applications to consume Real-time mainframe data. The absence of adequate methodologies in this process. This can result in systemic shutdowns with severe economic impacts. The professional trajectory described in this study reflects the evolution of these needs in job market. Experience in institutions such as the Bank of the State of Paraná and the HSBC Bank Brazil illustrates the complexity of maintaining data integrity in systems of Cards and customer information. The article delves deeper into this discussion, presenting analyses. about optimizing relational databases and leading multicultural teams in the management of critical software. The research offers a detailed overview of how engineering Enterprise software companies should work to extend the lifespan and efficiency of their technologies. classic.

## Methodology

The methodology adopted in this research bases its structure on participant observation and on... Analysis of multiple case studies over thirty-two years of direct professional practice. The primary data was collected from system performance monitoring. financial and logistical aspects in real-world production environments. The documentary research included a review of COBOL development protocols, of database administration manuals DB2 and legacy systems integration specifications. All information was treated with analytical rigor to identify patterns of operational failures and successes. The second methodological pillar consisted of identifying and categorizing incidents. Technical issues resolved through advanced diagnostic tools. Daily use of Software such as IBM Fault Analyzer and Advanced Query Tool provided valuable metrics. This data concerns memory behavior and SQL query response time. They allowed us to establish direct correlations between legacy code architecture and efficiency. batch processing. The quantitative analysis of these metrics underpins the Proposed recommendations for optimizing highly competitive environments. The third step of the research consisted of evaluating the dynamics of software engineering. applied to globally distributed teams. The control processes were analyzed. Source code release and deployment practices in automotive and banking corporations. The study evaluated the effectiveness of intercultural communication methodologies in reducing time.
