Summary:

Mid-market organizations in the advanced manufacturing and logistics sectors frequently face the challenge of converting operational data into strategic intelligence. Recent literature suggests that informational fragmentation in the supply chain tends to generate logistical bottlenecks and increase process variability.

This article explores, from a critical perspective, an intervention model that integrates the fundamentals of Lean Six Sigma methodology with the predictive capabilities of Business Analytics.

Through an analytical review, it is argued that this integration can favor data-driven decision-making, contributing to operational resilience. However, it is observed that the effectiveness of this model depends on overcoming technical and cultural barriers, which demands a strong investment in the analytical training of leaders.

Abstract:

Mid-market operational organizations in the advanced manufacturing and logistics sectors frequently face the challenge of converting data into strategic intelligence. Recent literature suggests that informational fragmentation in the supply chain tends to generate logistical bottlenecks and increase process variability. This article explores, from a critical perspective, an intervention model that integrates the foundations of the Lean Six Sigma methodology with the predictive capabilities of Business Analytics.

Through an analytical review, it is argued that this integration may favor data-driven decision-making, contributing to operational resilience.

However, the effectiveness of this model depends on overcoming technical and cultural barriers, requiring a strong investment in leadership analytical training.
