Strategic Management of Dedicated Logistics Operations, Efficiency in Supply Chains Industrial and Service Level Governance

Strategic Management of Dedicated Logistics Operations, Industrial Supply Chain Efficiency, and Service Level Governance

Strategic Management of Dedicated Logistics Operations, Efficiency of the Supply Chain Industrial and Service Level Governance

Marcelo Garcez da Silva

Executive with over 27 years of experience in road freight transport, logistics, and supply chain. Specialist in operational and commercial management, he serves as Operational and Commercial Director at Transportes Silveira Gomes Ltda. (TSG) and Director at LogX, with a solid track record in structuring dedicated operations and industrial supply. He holds an institutional leadership position as Managing Director and Coordinator of the Safety Committee at SETCERGS (Union of Freight Transport and Logistics Companies in the State of Rio Grande do Sul).

Summary

This article analyzes operational governance models, dedicated fleet management, and material flow optimization in industrial and retail supply chains. Based on literature from logistics administration, transportation engineering, and operations management, the study investigates the implementation of Key Performance Indicators (KPIs) and strict adherence to Service Level Agreements (SLAs) as drivers of profitability and productivity. The integration between road freight transport, warehousing, and less-than-truckload (LTL) distribution is discussed, evaluating the impact of process automation and strategic routing on reducing operational costs and continuously improving logistics performance. **Keywords:** Road freight transport.
Dedicated operations. Supply chain. Performance indicators. Service Level Agreement.

Abstract

This article analyzes operational governance models, dedicated fleet management, and material flow optimization within industrial and retail supply chains. Grounded in logistics management, transportation engineering, and operations management literature, the study investigates the implementation of Key Performance Indicators (KPIs) and strict compliance with Service Level Agreements (SLAs) as drivers of profitability and productivity. It discusses the integration between road freight transport, warehousing, and parcel distribution, evaluating the impact of process automation and strategic routing on operational cost reduction and continuous logistics performance enhancement.Keywords: Road freight transport. Dedicated operations. Supply chain. Performance indicators. Service Level Agreement.

Introduction

The evolution of global and regional supply chains has placed road freight transport in a position to improve the quality of transportation.

in a position of strategic centrality for industrial and commercial competitiveness. According to

Ballou (2004) and Bowersox, Closs and Cooper (2014) analyze the role of contemporary logistics.

It went beyond the simple physical movement of goods from one point to another to consolidate itself as a

Additionally, the methodology evaluates the efficiency of the integration between the Management systems of Transportation *Management System* (TMS) and Warehouse Management System (WMS) *Warehouse Management System).* The impact of electronic data interchange (EDI) and of is examined. Real-time tracking and end-to-end supply chain visibility, validating How automating information flow prevents operational bottlenecks and increases reliability. of the provision of services.

Chapter 1: Dedicated Operations Architecture and Integration in Industrial Supply

Designing a dedicated road freight transport operation requires proper sizing. Analytical analysis of customer demands and the rigorous alignment of operational assets. According to Ballou (2004), dedicated logistics is based on the exclusive allocation of vehicles, drivers and Supporting infrastructure to meet the specific requirements of a long-term contract. A Customization of equipment, such as curtain-side trailers, refrigerated truck bodies, or specific tanks. It optimizes the time for securing and consolidating cargo, increasing transport density. Industrial supply under the *Just-in-Time* (JIT) and *Milk-Run* models requires a high level of precision. surgical procedures are performed during collection and delivery windows. In the *Milk-Run model,* a single dedicated vehicle performs the procedure. Scheduled routes for collecting components from multiple suppliers and delivering them to the factory. at predetermined times. This system reduces inventory in transit *(pipeline inventory).* It eliminates congestion at factory receiving docks and maximizes utilization of... Useful volume of trucks.

Distribution network modeling and the strategic location of Distribution Centers (DCs) and *cross-docking* points ensure a continuous flow of materials. The operation of *Cross-docking* allows goods received in large vehicles to be immediately... consolidated and re-shipped in smaller vehicles for urban distribution, without the need prolonged storage. This streamlining reduces order cycle time *(lead time)* and decreases the costs of internal movement.

In addition to physical infrastructure, process integration requires alignment of sales teams. and operational aspects of the carrier with the supply managers of the contracting industry. A Conducting tactical alignment meetings and sharing demand forecasts. *(forecasting)* allows the carrier to plan driver schedules and preventive maintenance of the A fleet operating smoothly, absorbing operational peaks without degrading service levels.

It can be concluded that the architecture of dedicated operations is a determining factor for efficiency. Modern industrial. The symbiosis between the carrier and the industry transforms transportation from a an isolated cost center as an element of competitive differentiation, capable of guaranteeing the Continuous supply and productivity of manufacturing plants.

Chapter 2: Managing Service Level Agreements (SLAs) and Setting Logistics KPIs

(Main Chapter - With Illustrative Chart of Logistics Trade-Offs)

The governance of commercial and operational relationships in the transportation sector depends on formalization. of clear, transparent Service Level Agreements (SLAs) aligned with the strategic goals of customer. As Bowersox, Closs and Cooper (2014) teach, the SLA establishes the standard of minimum performance required for transportation and warehousing operations, defining metrics of evaluation, operational tolerances, and the financial penalties or bonuses associated with Meeting the established goals.

The parameterization of Key Performance Indicators (KPIs) is the instrument that operationalizes SLA monitoring. The *On-Time In-Full* (OTIF) indicator has become established as the key metric. sovereign quality in logistics, evaluating the percentage of deliveries made rigorously within the agreed timeframe and with the quantity and integrity of products exactly as ordered.

The daily monitoring of OTIF allows for the identification of deviations in specific stages of the original process. travel and act preventively before the monthly average of the indicator is compromised.

Achieving high levels of OTIF requires an understanding of the compensation curve *(Trade-(off)* between the level of service provided and the total logistical cost of the operation. Increase the delivery rate. Perfect levels of ninety percent, approaching one hundred percent, impose a growth that does not linear in freight costs, safety stocks, and dedicated resources.

Conclusion

The research developed throughout this article shows that road freight transport and modern logistics management require a multidisciplinary approach that encompasses operational excellence, financial rigor, and socio-environmental responsibility. The research demonstrates that structuring dedicated industrial supply operations under the principles of *Just-in-Time* and *Milk-Run* is the most efficient strategy for synchronizing production and transport flows, eliminating waste and ensuring the productivity of manufacturing plants.
The study confirms the centrality of Service Level Agreements (SLAs) and Key Performance Indicators (KPIs) in the governance of commercial relationships in the transportation sector. Daily monitoring of consolidated metrics such as *On-Time In-Full* (OTIF) and yard dwell time allows for the identification of operational bottlenecks in real time, ensuring contractual equality and end-customer satisfaction.

The application of fleet maintenance engineering concepts, combined with the use of analytical routing software and driver training in eco *-driving,* confirms that energy efficiency and cost reduction are fully compatible goals. Route optimization and predictive maintenance extend vehicle lifespan and substantially reduce fuel consumption and greenhouse gas emissions.

Quantitative analysis of operational costs and technical freight pricing are proving to be indispensable requirements for the financial sustainability of transportation companies. Mastering the matrix of fixed and variable costs and correctly applying tariff components such as Ad Valorem and GRIS ensures fleet profitability and protects the company against insolvency resulting from providing services below the actual cost.
Furthermore, the analysis of operational risks and the implementation of ESG guidelines consolidate freight transport as a sector undergoing profound transformation. Combating pollution through modern fleets and renewable fuels, coupled with promoting road safety and transparency in corporate governance, defines the new standard of excellence for contemporary transport companies.

Given the scenario of constant economic transformation and the growing demand for agility in commerce and industry, the professionalization of logistics management ceases to be a competitive advantage and becomes a survival imperative.
Overall, we realize that technical rigor, the strategic use of technology, and an ethical commitment to safety and the environment are the forces driving the development of road freight transport. Continuous investment in process modernization, employee training, and the alignment of commercial partnerships ensures business success, protects the country's infrastructure, and promotes sustainable socioeconomic progress.
