ABSTRACT: The increasing digitalization of educational institutions has significantly expanded the production and storage of academic and administrative information, making it necessary to use computer systems capable of organizing and analyzing this data efficiently. In this context, this study aimed to analyze how the modeling of computer systems, integrating relational databases and synthetic data, can contribute to supporting decision-making in school management.

Methodologically, the research is characterized as applied, with a qualitative approach and exploratory and descriptive objectives, developed through bibliographic review and...
This study proposes a three-tiered computational architecture. The proposed structure includes a relational database in SQL, mechanisms for validating academic information, the use of synthetic data for scenario simulation, and dashboards for visualizing institutional indicators. The results indicated that the integration of these technologies favors...
The organization of data, the automation of administrative processes, the generation of educational indicators, and greater analytical support for school administrators are key advantages. Furthermore, the use of synthetic data has demonstrated potential for conducting tests and analyses without compromising the privacy of institutional information. In conclusion, the proposed approach has the potential to strengthen data-driven school management practices, promoting greater efficiency, information security, and strategic support for decision-making.

Keywords: School management; Database; Synthetic data; Decision making; Educational dashboards.

ABSTRACT: The increasing digitalization of educational institutions has significantly expanded the generation and storage of academic and administrative information, necessitating computational systems capable of efficiently organizing and analyzing data. In this context, the study aimed to analyze how computational modeling systems that integrate relational databases and synthetic data can contribute to decision support in school management. Methodologically, the research is characterized as applied, with a qualitative approach and exploratory and descriptive objectives, developed through a literature review and the proposal of a three-layer computational architecture. The proposed structure includes a relational SQL database, academic information validation mechanisms, synthetic data for scenario simulation, and dashboards for visualizing institutional indicators. The results indicated that integrating these technologies improves data organization, the automation of administrative processes, the generation of educational indicators, and analytical support for school managers. Furthermore, the use of synthetic data demonstrated its potential to conduct tests and analyzes without compromising the privacy of institutional information. It is concluded that the proposed approach has the potential to strengthen data-driven school management practices, promoting greater efficiency, information security, and strategic support for decision-making.

In this way, it can be observed that data-driven school management constitutes a A fundamental approach to modernizing contemporary educational institutions. Garcia (2020) highlights the integrated use of analytical technologies and systems Computational tools significantly strengthen decision-making processes and increase efficiency. administrative and contributes to building more organized educational environments, strategic and evidence-based.

2.2 Database Systems Applied to Education

Database systems play an essential role in the organization and in Information management in educational environments. The increasing volume of data. The data produced by educational institutions requires structures capable of storing, processing, and to make information available in an efficient, secure and organized manner (Elmasri; Navathe, (2019). According to Geppart and Kotz (2019), databases represent mechanisms fundamental for the control and management of large volumes of information, allowing greater reliability and accessibility to stored records.

In the educational context, databases are used for management of enrollments, grades, school attendance, academic history, administrative data and indicators institutional. Costa and Oliveira (2022) state that the centralization of this information in Integrated systems reduce registration redundancies and significantly improve efficiency. operational efficiency of educational institutions. Furthermore, the use of organized structures is beneficial. Faster queries and more accurate analysis of educational data.

Database modeling is a fundamental step in the development of computer systems geared towards school management. Pressman (2016) highlights that the modeling allows you to define entities, relationships, and integrity rules that represent appropriately reflect the institutional reality within the computing environment. In this way, a A well-modeled data structure reduces informational inconsistencies and increases reliability. reliability of subsequent analyses.

Among the available models, relational databases stand out for... The ability to organize structured information into interrelated tables. According to According to Elmasri and Navathe (2019), the relational model presents a high level of integrity. referentiality and consistency of data, essential characteristics in environments that demand Strict control of stored information. In an educational context, data such as grades,

Year VII, v.1 2026 | Submission: 06/06/2026 | Accepted: 09/06/2026 | Publication: 12/06/2026

Frequency, classes, and subjects exhibit strong structural dependence, which requires Organized and consistent relationships between records.

Furthermore, the SQL language allows for the execution of complex queries and the Efficient cross-referencing of academic information. Elmasri and Navathe (2019) state that SQL It is one of the main tools for manipulating relational databases, allowing The generation of analytical reports, the monitoring of indicators, and structured recovery. institutional information. In this way, the use of SQL significantly expands the analytical capacity of computer systems geared towards educational management.

Although relational databases are widely used, new approaches, such as NoSQL databases have also been gaining ground in contemporary computing applications. Chen, Mao, and Liu (2014) highlight that NoSQL systems offer related advantages. due to structural flexibility, scalability, and distributed processing of large volumes. of unstructured data. These characteristics make this model suitable for applications which require high computational elasticity and the handling of heterogeneous data.

However, in the context of school management, the relational model presents greater [symbolism/preference]. Suitability due to the need for referential integrity, standardization, and transactional control. from academic information. Elmasri and Navathe (2019) state that relational databases They offer greater structural security in scenarios where different records depend on each other. directly from one another, as occurs in academic systems. In this way, the use of SQL This makes it more suitable for ensuring the consistency and reliability of educational data.

Another important aspect relates to information security in the systems. educational institutions. Zuboff (2019) highlights that institutions that store personal data need adopt rigorous access control and information protection mechanisms, especially In increasingly connected digital environments, database systems are crucial. They must incorporate encryption, authentication, and access monitoring features to to guarantee the security and privacy of institutional information.

In addition to security, the scalability of systems is also a relevant factor for... contemporary educational institutions. Sommerville (2019) states that systems Computational systems need to be developed considering the continuous growth in volume of data and the simultaneous increase in the number of users accessing institutional information. In this way, well-structured architectures contribute to greater operational stability and improved performance of school management systems.

Therefore, database systems are central elements in the construction of technological solutions geared toward education. Cardoso (2018) highlights the use of structures Organized data storage and analysis promotes greater administrative efficiency. greater informational reliability and strategic support for decision-making in institutions teaching.

2.3 Synthetic Data and Privacy

The use of synthetic data has become established as a relevant alternative for resolving issues related to privacy, security, and availability of Information in computing environments. The growth of digitization has expanded The collection and storage of personal data significantly increases, making it indispensable to developing strategies capable of enabling analyses and tests without compromising the sensitive user information (Zuboff, 2019). In the educational context, this need This becomes even more evident due to the large volume of academic and administrative data. that educational institutions manipulate daily.

According to Goodfellow, Bengio, and Courville (2016), synthetic data consist of sets of information artificially generated by computational models capable of reproduce statistical characteristics similar to those observed in real data. Although not While these data represent authentic records of specific individuals, they maintain consistent patterns. Distributions and behaviors close to reality, allowing for simulations and analyses. computational methods without direct exposure of the original information.

The use of real data in educational systems presents several limitations. related to privacy and protection of personal data. Information related to academic performance, school attendance, disciplinary record, and records Administrative matters are sensitive and require rigorous security mechanisms. confidentiality (Brazil, 2024). In this scenario, synthetic data emerges as an alternative. strategic for the development and validation of computer systems, without compromising the integrity of institutional information.

Furthermore, the use of synthetic data facilitates large-scale testing. scale and the simulation of varied scenarios in computer systems. Alpaydin (2021) highlights That environments based on artificial intelligence allow for the evaluation of algorithm performance. Test functionalities and validate applications without the risks associated with exposing real data.

Another element incorporated into the methodology was the use of synthetic data to simulate and to validate the computational system. Synthetic data were used as an alternative to Reproduction of academic scenarios, without exposing real user information. According to Goodfellow, Bengio and Courville (2016) argue that synthetic data allow for the preservation of statistical patterns. relevant without compromising the privacy of individuals, favoring development and Testing of computer applications in compliance with data protection requirements.

The generation of synthetic data took into account variables related to the context. educational, including school attendance, academic performance, class averages and indices of evasion. This data was used for consultation simulations, generation of indicators and Structural validation of the proposed system. The use of this artificial information allowed for... conducting computational tests without compromising the security and confidentiality of the academic records.

In addition, dashboard models were developed to visually represent the Indicators generated by the system. The dashboards simulate decision support features capable to present information about institutional performance, school attendance, and rates of dropout and academic performance. According to Few (2013), the graphical visualization of information It facilitates faster interpretation of organizational data and enhances analytical capabilities. of the managers.

In this way, the methodology adopted made it possible to structure a computational proposal. integrated, based on relational modeling, multi-layered architecture, data analysis and in The use of synthetic data to support evidence-based school management.

4. RESULTS AND DISCUSSION

The results of the system modeling demonstrated that the integration between banks of Relational data, synthetic data, and computational systems can contribute significantly for the modernization of school management. The developed proposal highlighted that the centralization of academic and administrative information promotes greater institutional organization, reducing problems related to data fragmentation, to Inconsistencies in registration data and difficulty accessing information. In school environments in Given that different sectors use independent records, the lack of integration often... It undermines the reliability of institutional indicators and makes monitoring more difficult. pedagogical and administrative demands.

The implemented relational structure proved to be better suited to the context. educational due to the need for logical organization between entities such as students, subjects, classes, attendance, and assessments. During the system modeling, it was observed that The use of a relational database enabled greater control over referential integrity and greater consistency among academic records. This feature proved essential for to avoid duplications, inconsistencies, and errors frequently found in controls. performed manually or in a decentralized manner.

Furthermore, it was found that the use of the SQL language significantly expanded the The analytical capacity of the proposed system. The possibility of performing structured queries and the The cross-referencing of information allowed for the automated generation of indicators related to academic performance, school attendance, and dropout rates. This process reduces the time required to obtain institutional information and promotes greater agility in Preparation of reports used by school administrators in the decision-making process.

Although NoSQL databases offer advantages in flexibility and scalability, The results indicated that its use would not be the most suitable alternative for the objectives. The central elements of this research are educational systems, which depend directly on relationships. structured and consistent transactional information across academic records, which requires Strict mechanisms for the integrity of tables and associated information. In this context, The relational model proved to be more efficient in ensuring structural stability. Information security and the reliability of the analyses performed by the system.

Another relevant result relates to the three-tiered computational architecture. used in the development of the proposal. The separation between the presentation layers, of The application and data management fostered a better structural organization of the system, allowing for greater Modularity and greater ease of maintenance. This division also contributes to future Application expansions, enabling the integration of new features without compromising functionality. the overall functioning of the system. In institutional environments, this characteristic becomes important due to the continuous need for technological updating and adaptation to organizational demands

The results also demonstrated that the use of synthetic data represents a an efficient alternative for conducting computational tests, simulations, and validations, without exposing sensitive user information. The artificial generation of data made it possible to reproduce scenarios close to academic reality, maintaining statistical standards similar to observed in real educational environments. In this way, it was possible to carry out analyses on

Even with these limitations, the results demonstrated that the integration between Relational databases, synthetic data, and decision support systems have increased potential to strengthen data-driven school management practices. The proposal It has become clear that computer engineering can contribute directly to... developing solutions capable of transforming academic information into support strategic to institutional planning, promoting greater administrative efficiency, Information security and analytical quality in educational decision-making processes.

FINAL CONSIDERATIONS

The aim of this research was to analyze how modeling and Implementation of computer systems, using synthetic data and databases. They can contribute to process optimization and support decision-making in management. school. From the analysis carried out, it was possible to understand that the integration of these Technologies have significant potential to improve the organization, processing, and Interpretation of educational information.

The results demonstrated that the use of relational databases provides greater control over the integrity and consistency of academic information, an essential factor in educational environments. The choice of the relational model proved to be appropriate due to The need for structured relationships between students, classes, assessments, and indicators. as well as the possibility of performing complex analytical queries through the language. SQL.

Similarly, it was found that synthetic data constitute an alternative. A strategic approach to expanding analyses and simulations without compromising user privacy. Using this resource allows you to develop tests, validate systems, and create predictive scenarios. without exposing sensitive information, while meeting security and data protection requirements.

Another relevant aspect identified was the contribution of the three-layer architecture. for the efficiency and scalability of the system. The separation between interface, processing and Storage facilitates the maintenance, updating, and expansion of the application, making it... a proposal that is more adaptable to the needs of educational institutions and provides greater operational stability.

Beyond the technical aspects, the study showed that data-driven systems They can strengthen evidence-based management practices. The automation of indicators and
